1 Project Background

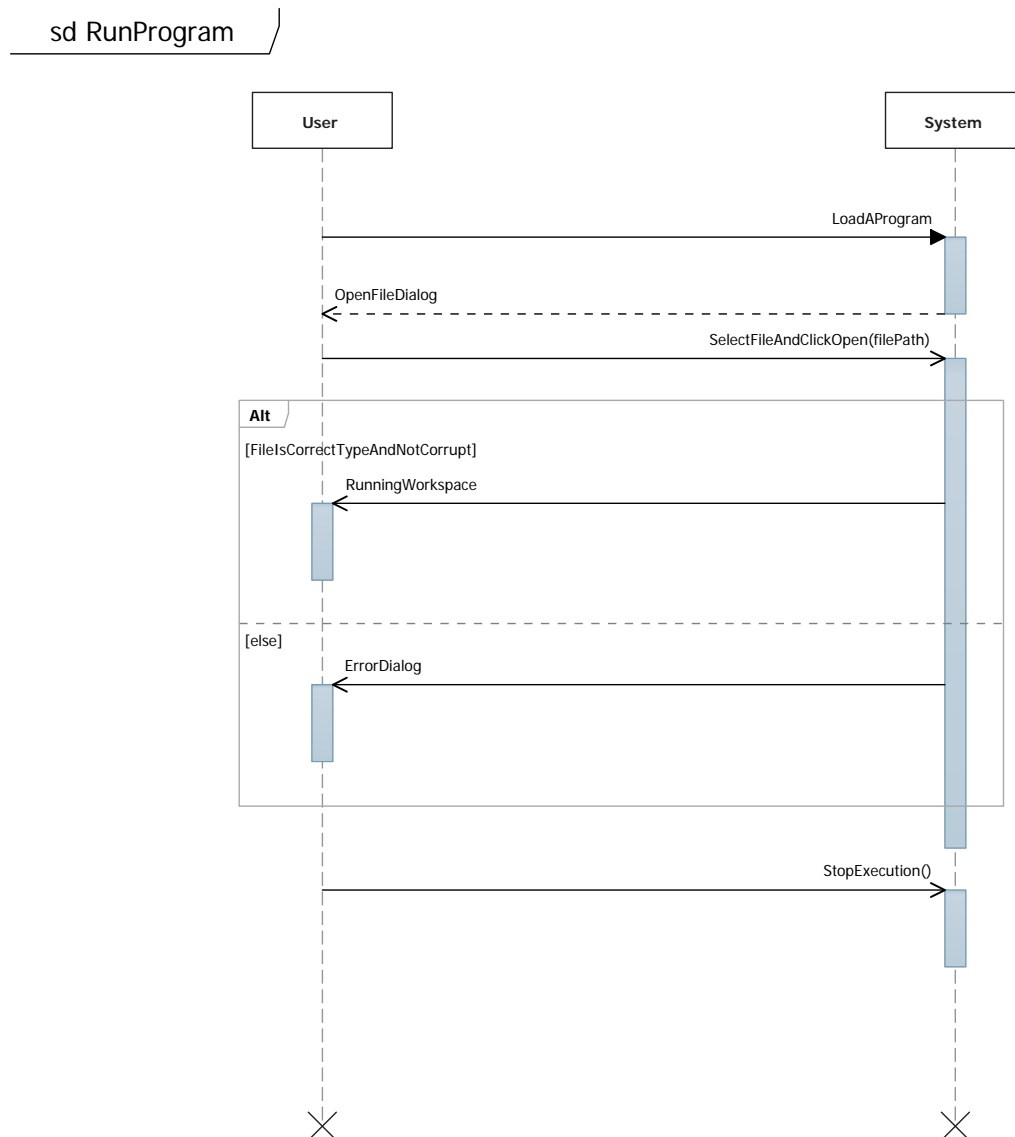

The Siftables Emulator is being developed by Singularity Software as part of the Junior Project sequence of classes at Rose-Hulman Institute of Technology. When projects were solicited for the sequence, clients Tim Ekl and Eric Stokes (both Rose-Hulman alumni) submitted a request for an emulator for Sifteo Cubes, a new platform intended for “intelligent play.” After Singularity was chosen for the project, we met with Mr. Ekl to determine the three primary features of the Emulator: a Workspace where 1-6 Cubes could mimic the manipulations possible with physical Cubes, an to program those virtual Cubes, and a set of example games designed to show off the first two features. Singularity’s Emulator is intended to build on the foundation of Sifteo, Inc.’s existing emulator by creating a more fluid and natural user interface.

The clients’ only implementation-specific specification was the ability to run the finished emulator on a Mac.

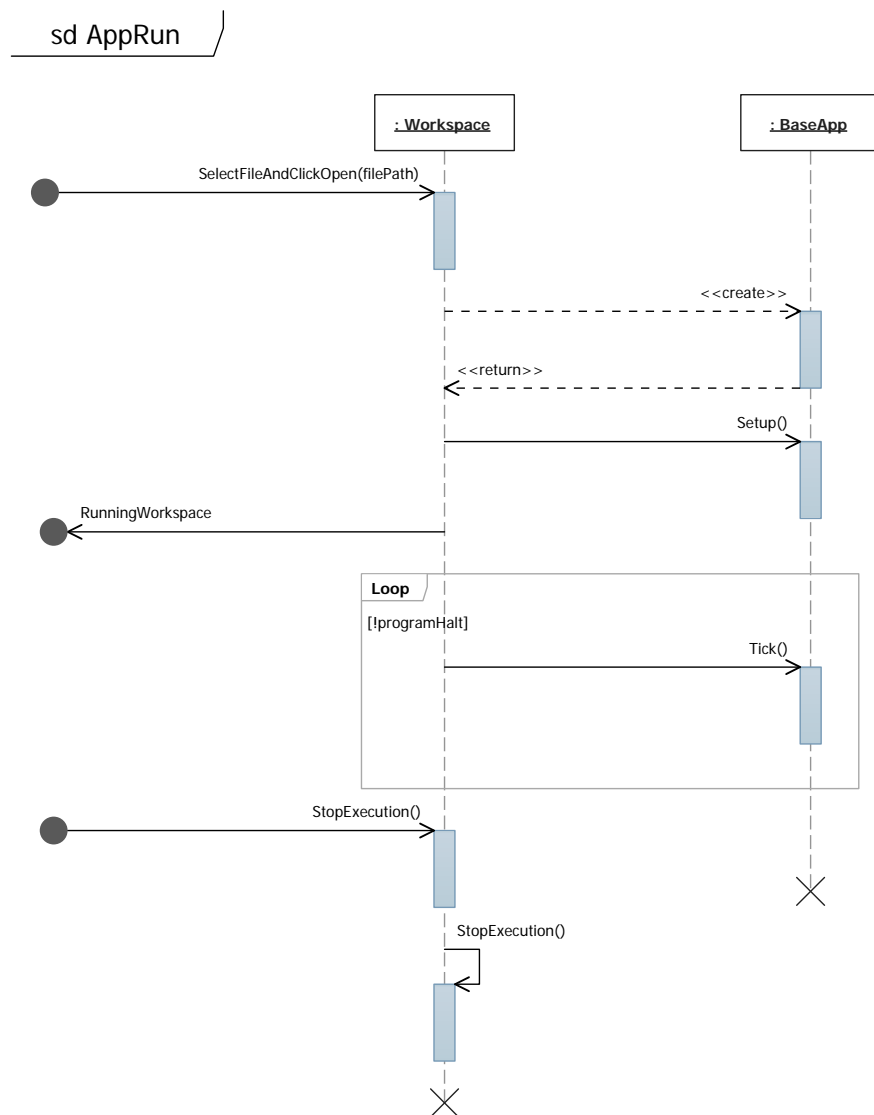

2 Analysis Models

2.1 System Sequence Diagram

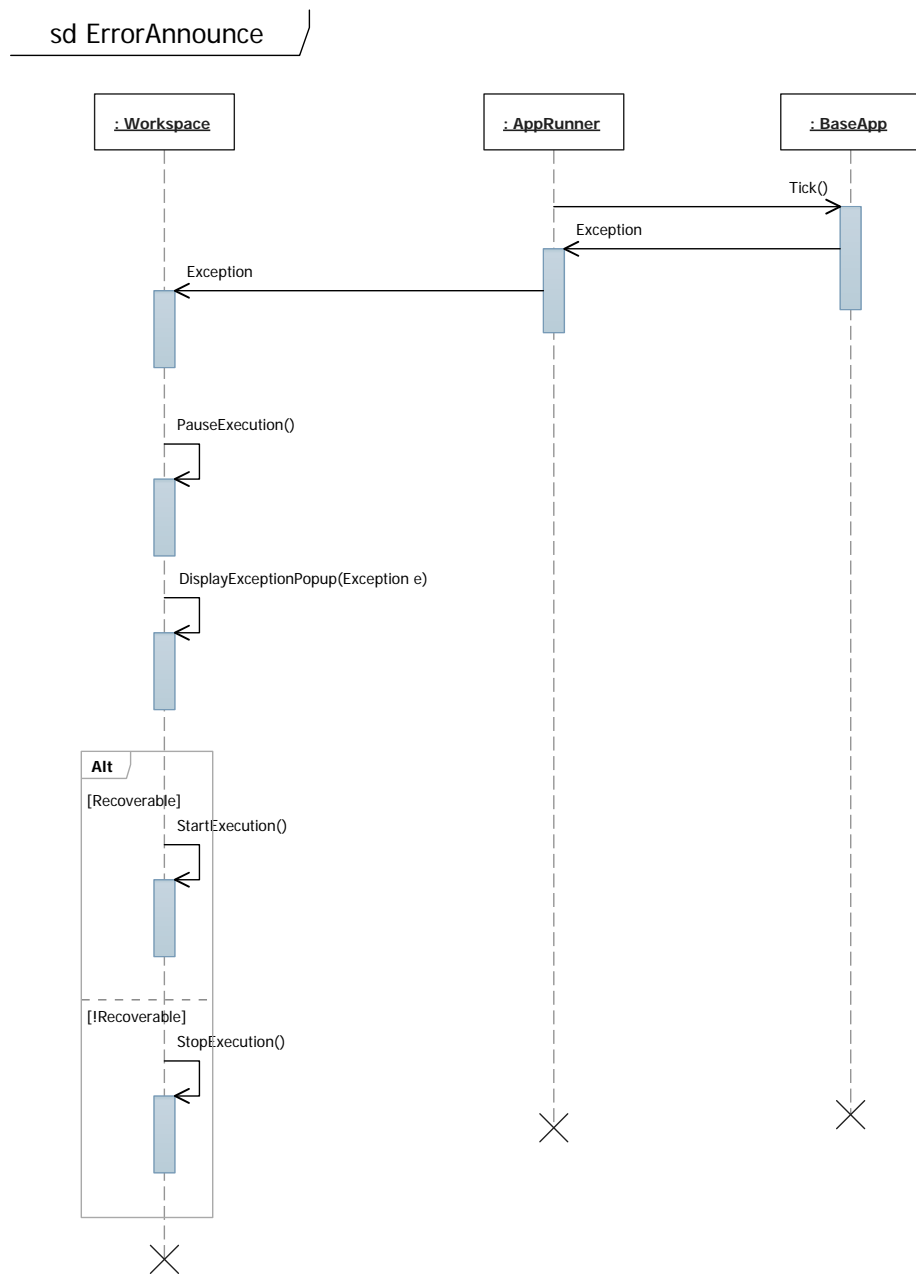

The initial RunProgram system sequence diagram had a duplicate step which was annihilated by replacing the *FileOpened* result with the *RunningWorkspace* result because the two were essentially duplicates.

2.2 Sequence Diagrams

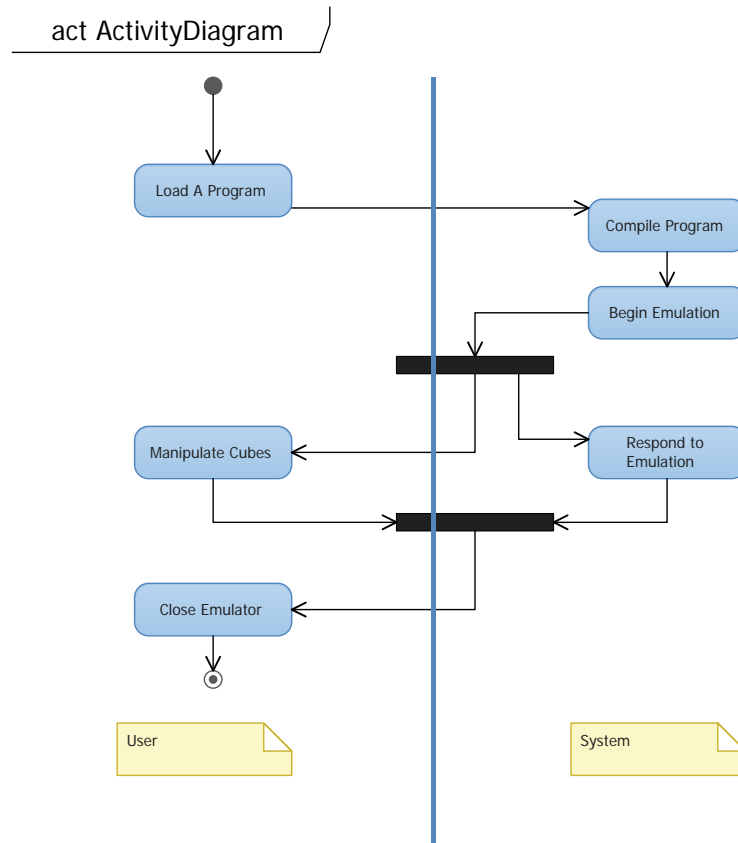

The *Setup()* operation is necessary in addition to a constructor because this is the way in which initialization of an application is handled per Sifteo's API. No changes were made to this sequence diagram because it is consistent with the way in which the system behaves during this operation.

The *Tick()* operation was unintentionally omitted from the original diagram, and it has been added for clarity to indicate that the action is taking place during an actively running application.

2.3 Activity Diagram

The following activity diagram details the process beginning with the user loading a program to the point at which the user closes the program.

2.4 Design Class Diagram

Any external relationships are shown beneath the class name to emphasize interaction with classes we did not create. For instance, each *Cube* is implemented as a *UserControl* object.

Additionally, every entity in our diagram is being implemented in our own original code, though many classes are inspired by the Sifteo API which we have to mirror. Those entities which do mirror the objects in the Sifteo domain will be separated into a distinct package to clarify the divide between those objects which carry out the emulation and those which the user primarily manipulates in their original applications.

Siftables

Class

Application

Methods

Application_Exit() : void

Application_Startup() : void

Application_UnhandledException() : void

ReportErrorToDOM() : void

Siftables()

AppRunner

Class

Fields

_app : BaseApp

_cubes : CubeSet

_isRunning : bool

_runner : Thread

_uiDispatcher : Dispatcher

Properties

Cubes : CubeSet

Running : bool

Methods

AppRunner()

PauseExecution() : void

Run() : void

StartExecution() : void

StopExecution() : void

MainWindowView

Class

UserControl

Methods

MainWindowView()

MainWindowViewModel

Class

Fields

_appRunner : AppRunner

_cubes : ObservableCollection<CubeView>

_status : string

ReadyStatus : string

Properties

ARunner : AppRunner

ChangeNumberOfCubesCommand : RelayCommand<EventArgs>

Cubes : ObservableCollection<CubeView>

LoadAFileCommand : RelayCommand

ReloadAFileCommand : RelayCommand

SiftCubeSet : CubeSet

SnapToGridCommand : RelayCommand

Status : string

Methods

MainWindowViewModel()

NotifyPropertyChanged() : void

Events

PropertyChanged : PropertyChangedEventHandler

ClipBehavior

Class

Fields

ToBoundsProperty : DependencyProperty

Methods

ClipToBounds() : void

fe_Loaded() : void

fe_SizeChanged() : void

GetToBounds() : bool

OnToBoundsPropertyChanged() : void

SetToBounds() : void

CubeView

Class

UserControl

Methods

CubeView()

CubeViewModel

Class

Fields

_backgroundColor : Brush

_cube : Cube

_screenItems : ObservableCollection<FrameworkElement>

Properties

BackgroundColor : Brush

CubeModel : Cube

ScreenItems : ObservableCollection<FrameworkElement>

Methods

CubeViewModel()

NotifyPropertyChanged() : void

UpdateBackgroundColor() : void

UpdateScreenItems() : void

Events

PropertyChanged : PropertyChangedEventHandler

DragAndDropBehavior

Class

Behavior<UIElement>

Fields

_isDragging : bool

mouseClickPosition : Point

parent : DependencyObject

Methods

AssociatedObject_MouseLeftButtonDown() : void

AssociatedObject_MouseLeftButtonUp() : void

AssociatedObject_MouseMove() : void

DragAndDropBehavior_MouseEnter() : void

DragAndDropBehavior_MouseLeave() : void

OnAttached() : void

OnDetaching() : void

BaseApp

Class

Fields

_cubes : CubeSet

FrameRate : int

Properties

Cubes : CubeSet

Methods

BaseApp()

Setup() : void

Tick() : void

MyApp

Class

BaseApp

Cube

Class

Fields

_backgroundColor : Color

_screenItems : Collection<FrameworkElement>

dimension : int

SCREEN_HEIGHT : int

SCREEN_MAX_X : int

SCREEN_MAX_Y : int

SCREEN_MIN_X : int

SCREEN_MIN_Y : int

SCREEN_WIDTH : int

Properties

BackgroundColor : Color

ScreenItems : Collection<FrameworkElement>

Methods

Cube()

FillRect() : void

FillScreen() : void

Events

NotifyBackgroundColorChanged : EventHandler

NotifyScreenItemsChanged : EventHandler

Nested Types

CubeSet

Class

Collection<Cube>

Methods

ClearEvents() : void

ClearUserData() : void

CubeByID() : Cube

CubeSet()

toArray() : Cube[]

Neighbors

Class

Fields

_neighbors : Cube[]

_numNeighbors : int

Properties

BOTTOM : Cube

Count : int

IsEmpty : bool

LEFT : Cube

RIGHT : Cube

TOP : Cube

Methods

Contains() : bool

CubeOnSide() : Cube

Neighbors()

SideOf() : Side

sideUtil() : void

Note: Because the class diagram was generated by Visual Studio, no associations were created (for instance, between the entity *Cube* which is associated with a unique *Neighbors* entity). We feel no clarity was lost by omitting these associations.

3 Applications of the GoF Principles

3.1 Facade

The emulator system is designed in such a way that application developers have just one point of entry: the Sifteo API. The developer can only interact via objects like Cubes, CubeSets, etc. as defined in the Sifteo package, and need not (and do not) have any notion of the specific implementation of the interactions between system-level components and the domain objects exposed by the Sifteo API.

3.2 Observer

The MVVM framework makes use of the interface `INotifyPropertyChanged`. The ViewModels have properties, and the changing of those properties is observed by the view, which responds as defined in the user interface. The use of bindings and `ItemsControl` objects allows the views to "observe" the ViewModels and their properties or observable collections. This supports loose coupling by abstracting the ViewModel away from the view so the view logic can be implemented independent of the final view.

3.3 Singleton

One instance of an `AppRunner` will be created, and when an application is loaded by the user it is associated with the `AppRunner`, along with the current `CubeSet` in the environment. If there were more than one `AppRunner` in the emulator workspace, then multiple applications could end up running and causing inconsistencies in the expected execution and the visual output in the workspace. Having `AppRunner` as a `Singleton` removes this potential inconsistency.

4 Acceptance Test Plan

The test cases included in this section are integration tests that simultaneously serve as acceptance tests for the user interface. Because the user interface is the focal point of the project, a functional user interface reasonably exemplifies a functional project. In the future, it may become necessary to test our implementations of the Sifteo package by adding further acceptance tests.

4.1 Load program

Scenario #	Originating Flow	Alternate Flow	Next Alternate
1	Basic flow		
2	Basic flow	Alternate flow 1	
3	Basic flow	Alternate flow 2	
4	Basic flow	Alternate flow 3	
5	Basic flow	Alternate flow 4	
6	Basic flow	Alternate flow 4	Basic flow

Test Case ID	Scenario	Description	Expected Result
1	1	A program is successfully loaded in the emulator.	The Cubes run the selected program in the Workspace.
2	2	User selects incompatible file type.	“The selected file is not a proper Siftables application and cannot be loaded.” error is displayed.
3	3	User selects corrupt or unloadable file.	“The selected file is corrupt and cannot be loaded.” error is displayed.
4	4	User cancels loading program.	The emulator returns to its state before the basic flow was entered.
5	5	User loads a program when a program is already running and chooses “Cancel” on the warning prompt.	Emulator returns to its state before the basic flow was entered after “Cancel” is chosen.
6	6	User loads a program when a program is already running and chooses “Continue” on the warning prompt.	Cubes run the selected program in the Workspace after “Continue” is chosen.

4.2 Reload program

Scenario #	Originating Flow	Alternate Flow
1	Basic flow	
2	Basic flow	Alternate flow 1

Test Case ID	Scenario	Description	Expected Result
1	1	The program is successfully reloaded in the emulator.	The Cubes run the selected program in the Workspace after the user presses “Continue” on the warning message.
2	2	The user selects “Cancel” on the warning dialog (which specifies that the emulator will be reset).	The Cubes run the program as originally specified; no change should be made to emulator’s state.

4.3 Zoom screen

Scenario #	Originating Flow
1	Basic flow

Test Case ID	Scenario	Description	Expected Result
1	1	User zooms in fully.	The Workspace view has been zoomed to twice its original size.
2	1	User zooms out fully.	The entire Workspace is visible.

4.4 Add/remove Cubes

Scenario #	Originating Flow
1	Basic flow

Test Case ID	Scenario	Description	Expected Result
1	1	The spinbox is changed to an integer in the range [1, 6].	The specified number of Cubes is shown in the Workspace.

4.5 Snap Cubes to grid

Scenario #	Originating Flow
1	Basic flow

Test Case ID	Scenario	Description	Expected Result
1	1	User presses the “Snap to Grid” button.	The emulator aligns the Cubes in a grid based on their current positions.

4.6 Manipulate Cube

Scenario #	Originating Flow
1	Basic flow
2	Alternate flow 1
3	Alternate flow 2
4	Alternate flow 3

Test Case ID	Scenario	Description	Expected Result
1	1	The user double clicks on a Cube.	The Cube responds as if a screen click occurred.
2	2	The user clicks on one of the buttons on the Cube.	The Cube executes and responds to the associated action (flip, rotate, or tilt).
3	3	The user drags a Cube next to another Cube.	The Cube neighbors with the adjacent Cube, and the two recognize each other as neighbors.
4	4	The user drags a Cube back and forth in a shaking manner.	The Cube responds as if shaken.
